1. Describing the data that we are using

we are using the dataset from this study

2. reading the data table into R

First make sure we are in the correct working directory “getwd()” “/Users/atziri/Bio 195-197/Data Science”
if it is not right set the working directory with ‘setwd()’

```
read.csv(file = "/Users/atziri/Bio 195-197/Data Science/raw-data/ACACIA_DREPANOLOBIUM_SURVEY.txt", sep = ";")

'head()' gives us the first six rows

```

make sure that everything that should be a numeric value is a number one way to check is the 'summary()' command

another way is using the type function

```
typeof(acacia[, "HEIGHT"])
```

```

```

we identified a column that has problematic data we need to fix this

We are going to read the data table again, but we are going to assign 'NA' to the "dead value" that we don't want in our arguments are always plain text

```
acacia <- read.csv(file = "/Users/atziri/Bio 195-197/Data Science/raw-data/ACACIA_DREPANOLOBIUM_SURVEY.")
```

4. Visualize our data

For this we are using the 'ggplot' package. let's install and load it

```
# install.packages("ggplot2")
library(ggplot2)
```

Now We are going to create our first plotting layer with the function 'ggplot'.

```
colnames(acacia)
